U.S. Patent and Trademark Office PTOL-303 (Rev. 08-06)

Continuation of 11, does NOT place the application in condition for allowance because:

Applicant argues that the rejection with Golds in view of Banas does not teach the limitation of a distensible support structure in direct contact with an inner tubular body. Examiner disagrees and maintains the rejection. To clarify, Golds teaches the invention including an inner tubular member (24), a stent (36, distensible support structure) in direct contact with the inner member (Figure 8 of Golds), and an outer structure made of ePTFE. Golds does not teach that the stent and outer ePTFE structure are in the form of a tape strip that is wound around the inner member.

Banas teaches an inner tubular member (12), and a tape strip that is formed of a stent/support structure (14) and an outer member (11) formed of PTFE. Banas shows that it is more desirable to place the outer structure combined with the stent onto the inner tubular member when it is in the form of a tape because this allows the user to control the location and placement of the stent onto the inner member allowing the user more control over the flexibility of the completed structure.
